

Virtual Technical Conference Platform

Requirements Table (FR-001–FR-005, NFR-001–NFR-002)

Actors: Conference Author, Reviewer, Track Chair

Req ID	Type	Description	Priority	Acceptance Criteria	Rationale
FR-001	Functional	The system shall anonymize submitted manuscripts (strip author headers and metadata) before assigning them to reviewer pools for double-blind review.	High	Pass: Reviewer sees anonymized paper. Fail: Author identity visible to peer reviewer.	Given (provided guideline requirement for double-blind review).
FR-002	Functional	The system shall generate a presentation schedule such that no two sessions in the same track share overlapping time slots, no room is double-booked, and no speaker is assigned to two sessions at the same time.	High	Pass: A generated schedule shows zero instances of room double-booking or speaker time conflicts across all tracks. Fail: At least one session overlaps in room, time, or speaker assignment.	Without conflict-free scheduling, speakers could be double-booked or rooms overbooked, disrupting the conference and damaging attendee/author trust.
FR-003	Functional	The system shall allow authors attending a session to submit questions and upvote questions submitted by others in a real-time queue.	High	Pass: A submitted question appears in the live queue within a few seconds and its position updates immediately when upvoted. Fail: Submitted/upvoted questions do not appear or reorder in the queue.	Real-time upvoted Q&A is one of the platform's three core features named in the problem statement; without it, sessions lose the mechanism for surfacing the most relevant audience questions.
FR-004	Functional	The system shall display the highest-upvoted, unanswered question at the top of the Q&A queue for the Track Chair moderating the session.	Medium	Pass: The top-ranked question in the Track Chair's view always matches the question with the highest current upvote count. Fail: A lower-upvoted question is shown above a higher-upvoted one.	Enables the Track Chair to moderate sessions efficiently by surfacing the most relevant question without manually scanning the full queue.
FR-005	Functional	The system shall allow an Author to submit a manuscript along with required metadata (title, abstract, track) for review.	High	Pass: A submitted manuscript appears in the Track Chair's review queue with all required metadata attached. Fail: Submission fails, or required metadata is missing/incomplete.	This is the entry point for the entire review pipeline — without it, no paper can proceed to anonymization (FR-001) or review assignment.
NFR-001	Nonfunctional (Performance & Security)	The multi-track schedule generator shall resolve session room capacities and speaker availability constraints in under 10 seconds.	High	Pass: Benchmarking tests confirm target latency and security standards under simulated peak load.	Given (provided guideline requirement).
NFR-002	Nonfunctional (Usability)	The Track Chair's schedule and Q&A moderation dashboard shall present all conflict alerts and top-ranked questions	Medium	Pass: Usability testing confirms Track Chairs reach any conflict alert or top question within 2 clicks from	Track Chairs manage this in real time during live sessions and busy review periods — a cluttered or deep-nested UI
